Noise temperature - Wikipedia
Thu, 07 Feb 2019 17:46:00 GMT
In electronics, noise temperature is one way of expressing the level of available noise power introduced by a component or source. The power spectral density of the noise is expressed in terms of the temperature (in kelvins) that would produce that level of Johnson–Nyquist noise, thus: = where: is the noise power (in W, watts) is the total bandwidth (Hz, hertz) over which that noise power is ...
